

3. (Amended) The door module of claim 2, wherein the substantially elastic portion comprises two lip seals for extending in parallel along the outer rim area of the door module.

4. (Amended) The door module of claim 1, wherein the substantially elastic portion comprises a drip ledge.

5. (Amended) The door module of claim 1, wherein the substantially elastic portion comprises one or more wiring harness clips.

6. (Amended) The door module of claim 1, wherein the substantially elastic portion comprises attachment elements for attaching the door module to the door.

pub
B2
7. (Amended) The door module of claim 1, wherein the substantially elastic portion comprises attachment elements for attaching electrical and/or electronic elements to the door module.

8. (Amended) The door module of claim 1, wherein the substantially elastic portion comprises attachment means for attaching noise reduction elements to at least one side of the door module.

9. (Amended) The door module of claim 1, wherein the substantially elastic portion comprises a lip for contacting a door window.

10. The door module of claim 1, wherein the long glass fibers of the long glass fiber enforced plastic material are staple glass fibers.

11. The door module of claim 1, wherein the glass fiber portion of the long glass fiber enforced plastic material is between 30 and 70%.

12. The door module of claim 11, wherein the glass fiber portion of the long glass fiber enforced plastic material is approximately 40%.

13. The door module of claim 1, wherein the glass fibers of the long glass fiber enforced plastic material have a length of approximately 20 mm, and a thickness of approximately 0.02 mm.

14. The door module of claim 1, wherein the plastic material is polypropylene.

15. (Amended) A mould for manufacturing a door module for a vehicle door by compression moulding, the mould being arranged to receive a long glass fiber enriched plastic material, and for shaping a substantially rigid portion of the door module during compression moulding, and comprising one or more cavities of such dimensions that during compression moulding, plastic material substantially free of long glass fibers may be forced into at least part of the one or more cavities, thereby to shape a substantially elastic portion of the door module.

16. The mould of claim 15, further comprising a heater for heating the long glass fiber enriched plastic material received in the mould.

17. (Amended) The mould of claim 15, wherein the substantially elastic structure comprises one or more elastic elements such as a lip seal, and the cavity has the inverse shape of the one or more elastic elements to be formed during compression moulding.

18. (Amended) A process of manufacturing a door module for a vehicle door, the process comprising:

providing a mould for shaping a substantially rigid portion of the door module, the mould comprising one or more cavities;

filling the mould with a long glass fiber enriched plastic material;

exerting pressure on the long glass fiber enriched plastic material received in the mould, wherein said one or more cavities in the mould are of such dimensions that plastic material substantially free of long glass fibers is forced into at least part of the one or more cavities; and

hardening of the glass fiber enriched and substantially free of glass fiber portions.

19. The process of claim 18, further comprising:
heating the long glass fiber enriched plastic material received in the mould before exerting
pressure

20. (Amended) The process of 18, further comprising:
trimming the substantially free of glass fiber structure so as to obtain one or more wiring harness

21. (Amended) The process of claim 18, wherein the cavity has the inverse shape of a lip
extending along the outer rim area of the door module, the process further comprising:
bending the lip relative to the surface of the glass fiber enriched portion so that a cross section of the
lip is at an angle to the surface of the glass fiber enriched portion.

22. (Amended) The process of claim 18, further comprising:
trimming the substantially free of glass fiber structure so as to obtain a lip whose cross section is at
an angle to the surface of the glass fiber enriched portion.

23. (New) A vehicle door comprising:
an inside panel with a surface cut-out recess; and
a door module for covering the surface cut-out recess in the inside panel,
wherein the door module includes a substantially rigid portion of long glass fiber reinforced plastic
and a substantially elastic portion of plastic substantially free of long glass fibers and formed integrally with
the substantially rigid portion.

24. (New) The vehicle door of claim 23, further comprising an outside panel, wherein the door
is divided into a wet cell lying between the outside panel and the door module and a dry cell lying between
the door module and an adjoining inside trim.

25. (New) The vehicle door of claim 23, wherein the substantially elastic portion comprises a
lip seal extending along an outer rim area of the door module, for sealing a connection between the door
module and the inside panel.
